Calgranulin B (Neutrophil cytosolic 23 kDa protein) (P23) (BEE22)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           kDa subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cytoskeleton.
--- TISSUE SPECIFICITY: Found essentially in phagocytic cells.
--- PTM: Phosphorylated by protein kinase C.
---- SIMILARITY: Belongs to the S-100 family.
--- SIMILARITY: Contains 2 EF-hand calcium-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        InterPro; IPR01751; CaBP $100.

C -! FUNCTION: Requilatory subunit of calcineurim, a calcium-dependent, calmodulin stimulated protein phosphatase. Confers calcium sensitivity (By similarity).
C -! SUBUNIT: Composed of a catalytic subunit (A) and a regulatory subunit (B) (By similarity).
C -! MISCELLANEOUS: This protein has four functional calcium-binding sites (By similarity).
C -! MISCELLANEOUS: This protein has four functional calcium-binding sites (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             25-OCT-2004 (Rel. 45, Created)

Science 277:1453-1474(1997)
-!- FUNCTION: Involved in induction of the so-called NTR enzymes in responsé to nitrogen deprivation, as well as in glutamate blosynthesis. May mediate the glutamate-dependent repression of the GIT; operon.
-!- SIMILARITY: To E.coli yhcF.

                                                                                                                                                                                                                                                          This sequence represents the CAAFI calcium-binding protein isolated from human amniotic fluid. CAAFI belongs to the $100 protein family, which hinludes calcylin, MRPB, and MRP14. Intracellular calcium ion concentration is one of the kap factors for intracellular signal transduction. The calcium signals are transduced by various calciumbinding proteins, such as this protein. CAAFI is normally expressed in squamous epithelial cells, neutrophils and macrophages, but atypical epithelial dells are negative for CAAFI and overexpression is observed is several types of cancer cells and neutrophils/macrophages infiltrating sacrecans lesions. Detection of CAAFI (using antibodies in usual immunoassays) can be used to diagnose (or monitor) inflammation, neoplasia (particularly squamous cell carcinoma of the skin, oesophagus, lung and cervix), and skin and blood diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       80

This is a human chemotactic cytokine I polypeptide. The encoding polynucleotide, along with a vector and a host cell can be used for the recombinant production of the chemotactic cytokine. Cytokine agonists and antagonists can be used for the treatment of a patient requiring a chemotactic cytokine I and for the treatment of a patient requiring the inhibition of a chemotactic cytokine I polypeptide, respectively. The chemotactic cytokine is used to treat tumours, chronic infection, leukaemia and T-cell mediated autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         180

This invention describes a novel composition for treating primary or secondary cardiomyopathy or cardiac insufficiency contains at least one secondary cardiomyopathy or cardiac insufficiency contains at least one $100 protein (I) or nucleic acid (II) encoding (I), or their mutants or fragments, or a gene transfer vector containing (II), optionally correlated with auxiliaries and/or carriers. (I) are calcium-binding proteins involved in calcium homeostasis, so their overapression in cardiac muscle will improve pumping capacity (and overapression) of the heart. In cultured myocardial cals they increase the contraction and correlation retical processed systolic calcium ion release from the sarchoplasmic reticulum (SR) and calcium re-uptake by SR. (I) are used to treat cardiomyopathy (CMP) where inherited or caused by C. used to treat cardiomyopathy (CMP) where inherited or caused by C. used to treat and/or arterial hypertension, and structural disease caused by pulmonary and/or arterial hypertension, and structural disease caused by right reduced contractile force. Unlike calmodulin, which is expressed ubdantating defect in the sarcoplasmic reticulum (SR) that causes cardiac

Sequence 92 AA;

```
The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymolecties sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the retinol-binding plasma protein, precursor of femilies. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polymolectides and polypeptides are used for disgnosis, prognosis, polymolectides and polypeptides are used for disgnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and parkinson's diseases, amyorrophic lateral sclerosis, rheumatoid parkinson's diseases, amyorrophic lateral sclerosis, rheumatoid polyarbhritis and lupus erythematosus, including use as waccines and in plant character of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                 240

The specification describes a method which uses at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GMZ activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The

          prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatcid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymorleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GNZ activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polymocleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and prevention and treatment of multiple sclerosis (in its various forms and parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polymathritis and lupus erythematosus; including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
Detecting, preventing and treating degenerative, neurological and autoimmune diseases, particularly multiple sclerosis, using specified polypeptides or related nucleic acid or ligand.
                                                                                                                                                                                                                                                                                  Claim 1; Page 167; 209pp; French

The present invention describes a method for diagnosing inflammatory diseases, which comprises determining the amount and/or concentration of diseases, which comprises determining the amount and/or concentration of calgranulin C polypeptide and/or nucleic acids encoding the polypeptide present in the biological sample. Also described are methods for treating or preventing an inflammatory disease in a mammal, and medical treatment or preventing or prevented. Calgranulin C has antinflammatory activity and can be used in gene therapy. The method is useful for diagnosing, treating or preventing inflammatory diseases, e.g. vasculitis treating or preventing inflammatory disease, chronic inflammatory diseases, chronic inflammatory arthritis (e.g. psoriatic fibrosis, chronic bronchitis inflammatory arthritis (e.g. psoriatic arthritis, rheumatoid arthritis or seronegative arthritis), systemic onset juvenile rheumatoid arthritis (source inflammatory disease), acute inflammatory disease.

CC (SOURA or Still's disease), acute inflammation above the background of a chronic inflammatory disease, or an exacerbation of an already present disease.

CC chronic inflammatory disease, or an exacerbation of an already present disease.

CC diseases for determining the risk of relapse, and for discriminating the present sequence represents in in the exemplification of the present in income in the present sequence represents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                  Wood WI;

Novel PRO polypeptide e.g., PRO69614, PRO71106, or PRO86388 useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis or
Human; PRO; immune related disorder; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; juvenile chronic arthritis; systemic sclerosis; Sjogren's syndrome; vasculitis; sarcoidosis; autoimmune haemolytic anaemia; autoimmune thrombocytopenia; thyroiditis; diabetes mellitus; renal disease; demyelinating disease; central nervous system; peripheral nervous system; demyelinating polyneuropathy; duillain-Barre syndrome; chronic inflammatory demyelinating polyneuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogram's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central tor peripheral nervous system, demyelinating diseases of the Guillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy, polyneuropathy. This sequence represents a human PRO polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Williams PM;

This invention relates to the novel association of protein sequences (and the genes which encode them) to the NF-kappaB pathway. The invention may be useful for the production of compounds with an antiinflammatory, cytostatic, hepatotropic, virucide, antiarteriosclerotic, antirheumatic, cytostatic, hepatotropic, virucide, antiarteriosclerotic, antirheumatic, castrontestinal-Gen, antischmatic, antiarteriosclerotic, mannoachilator, cerebroprotective, vasotropic, immunosuppressive or vulnerary activity or for gene therapy. The proteins and nucleotides are useful for diagnosing, preventing, treating, or ameliorating conditions or diseases associated with the NF-kappaB pathway. The condition is an immune disorder, an inflammatory disorder, an inflammatory disorder. cordermal dysplasia, hematoropietic tumours, hyper-IgM related to aberrant NF-kappaB regulation, cancer, aberrant apoptosis, related to aberrant MF-kappaB regulation, cancer, aberrant apoptosis, cordermal dysplasia, immunodeficiency, viral infections, HV-1, HTM-1, etcodermal dysplasia, immunodeficiency, viral infections, host cell survival, evasion of immune responses, rheumatorid arthritis, inflammatory bowel disease, colitis, asthma, atherosclerosis, cachexia, euthyroid sick syndromes, stroke, EAB, autoimmune disorders related to aberrant acute phase responses, hypercongenital conditions, birth defects, necrotic lesions, wounds, corgan transplant rejection, conditions related to corgan transplant rejection, disorders related to aberrant signal transplant rejection, conditions related to corgan transplant rejection, other viruses. The present sequence is that of a human protein which is subject to the novel association with the NF-kappaB pathway of the invention. Note: This sequence does not appear in the specification but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CTTGCAAACACCATCAAGAATATCAAAGATAAAGCTGTCATTGATGAAATATTCCAAGGC 180

erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral New PRO polypeptides and polynucleotides, useful for treating e.g. WPI; 2004-419628/ N-PSDB; ADP23920. nervous system.

Claim 7; SE¢ ID NO 1099; 2940pp; English.

polypeptide encoded by it. A protein of the invention has antiinflammatory, antiarthritic, antirheumatic, immunosuppressive, osteopathic, antidabetic, dermatological, antipporiatic, antidabetic, antidabetic, and respiratory activity. A polymucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its of the invention may have a use in gene therapy. The PRO polypeptide, its continuous proposal properties and interpretation may have a use in gene therapy. The PRO polypeptide, its continuous properties and interpretation interpretation interpretation interpretation interpretation interpretation into a spondyloanthropathy, systemic sclerosis, and idiopathic inflammatory myopathy, sjogren's syndrome, systemic sclerosis, and idiopathic antipolities, diabetes mellitus, immune-mediated renal disease, a demyelinating disease of the central or peripheral nervous system, idiopathic demyelinating polymeuropathy, Guillain-Barre syndrome, a chronic inflammatory demyelinating polymeuropathy, dillain-Barre syndrome, continuous or autoimmune chronic active hepatitis, primary cirrhoais, granulomatous hepatitis, sclerosing cholangitis, inflammatory howel disease, infectious or autoimmune chronic active hepatitis, primary cirrhoais, granulomatous hepatitis, sclerosing cholangitis, inflammatory howel disease, infectious or autoimmune chronic active hepatitis, publication con control co disease, an autoimmune or immune-mediated skin disease, a bullous skin disease, erythema multiforme, context dermatitis, psoriasis, an allergic disease, aethma, allergic rhintis, atopic dermatitis, food hypersensitivity, urticaria, an immunologic disease of the lung, cost soft pullous costnophilic pneumonia, idiopathic pulmonary fibrosis, hypersensitivity pneumonitis, a transplantation associated disease, graft rejection or graft-versus-host disease. The present sequence represents a PRO protein The invention relates to a novel isolated nucleic acid and the PRO the invention.

New nucleic acid encoding PRO polypeptide, useful for diagnosing and treating psoriasis, Crohn's disease, Ulcerative Colitis, or rheumatoid arthritis.

Claim 9; SEQ ID NO 50; 166pp; English.

The present sequence is the protein sequence of novel human PRO
polypeptide PR062943. The invention provides newly identified and
isolated nucleotide sequences encoding polypeptides referred to as PRO
polypeptides that are useful in the diagnosis and treatment of immunepolypeptides that are useful in the diagnosis and treatment of immunerelated diseases. Microarray analysis showed that expression of PR062943

related diseases. Microarray analysis showed that expression of PR062943

related diseases. Microarray analysis showed that expression of PR062943

related diseases. Microarray analysis showed that expression of PR062943

related diseases. Microarray analysis showed that expression of Endo
relation psoriasis patients and up-regulated 2-fold upon activation of CD4 T cells with CD28

or ICAM, down-regulated 6-fold upon activation of CD4 T cells with CD28

or ICAM, down-regulated 6-fold upon activation media and up-regulated 4-fold
upon activation of monocytes with LPS. PR062943 can be used in a claimed
method of identifying a compound that inhibits expression of the gene
concoding it. The candidate compound is especially an antisense nucleic
caid. The PRO POLYPEPTIGE can be obtained by recombinant expression,
especially in CHO, Escherichia coli or yeast host cells. The polypeptide,

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypoptide or polymucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GW2 activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polymucleotides and polypeptides are used for diagnosis, prognosis, or prevention and treatment of multiple sclerosis (in its various forms and parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as waccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GATGCTAATCAAGATGAACAGGTCGACTTTCAAGAATTCATATCCTGGTAGCCATTGCG 243

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                      The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creation (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders (nov) tyng abscrant procein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cappanessing for general mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid dequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the winy and the printed specification, but was obtained in the winy and the printed specification, but was obtained in the winy and the printed specification, but was obtained in the winy and the printed specification and the printed 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               115 AAGGAGCTTGCAAACACCATCAAGATATCAAAGATAAAGCTGTCATTGATGAAATATTC 174

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 4, Application US/09826589

Patent No. 6670136

GRNERAL INFORMATION:
APPLICANT: Schmidt, Ann Marie
APPLICANT: Schmidt, Ann Marie
APPLICANT: Schmidt, Ann Warse
TITLE OF INVENTION: EXTRACELLULAR NOVEL RAGE BINDING PROTEIN (EN-RAGE) AND USES THERE
CURRENT APPLICATION UNMBER: US/09/826,589
CURRENT FILING DATE: 2001-04-05
NUMBER OF SEQ ID NOS: 6
SOFTWARE: Patentin version 3.1
SEQ ID NO 4
LENGTH: 90
                                                                                                                                                                                                    US-09-826-589-3
; Sequence 3, Application US/09826589
